

Part 0 :

1 -Choose Your Dataset

1 - Where does the data come from? Data from Kaggle

2 - What is the structure? CSV

3 - Roughly how many documents / records does it contain? It have 7807 record

2 - Design Your Chunking Strategy

1. Describe the chunking strategy you arrived at and how you defined it.

I will chunk row by row; I will define it based on data

2. • Explain your reasoning: what did you observe about your data that led to this decision?

The data talking about diet food and its very important content to decision it after increasing rete of Obesity

3. • What did you try or consider that you rejected, and why?

I consider to a lot of contents but data not available in a lot of content like games and music

4. What are the weaknesses of your approach, and how did you mitigate them (chunk size, overlap, metadata)?

The weakness is the size of data and data will be lose in chunking, I mitigate them by reduce chunk size and increase overlap

Level 1 — Foundation (Mandatory)

. Justify your choice of embedding model in the report (multilingual support, dimension size, speed, cost)
